

Garmin InReach® Devices with Satellite Iridium Communications

Stay in touch via the globally-reaching Iridium satellite network. With two-way messaging you can update your team, enjoy reliable navigation features, and, in a worst-case scenario, use the SOS functionality for emergency assistance. You can use the tracking feature on your InReach satellite communicator to record track points and transmit them over the Iridium network at a minimum interval of 2 minutes. Traksat is providing special airtime packages and full integration with our web platform unlocking the full potential of Garmin InReach devices.

Location Tracking

No matter you have an entry package, you can still benefit from the minimum GPS report rate of 2 minutes. All your tracks are recorded and kept as long as you have a live subscription and you can recall them anytime through various map and tabular report types.

Two-Way Messaging

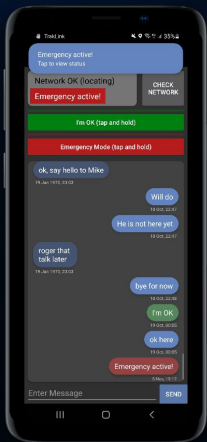

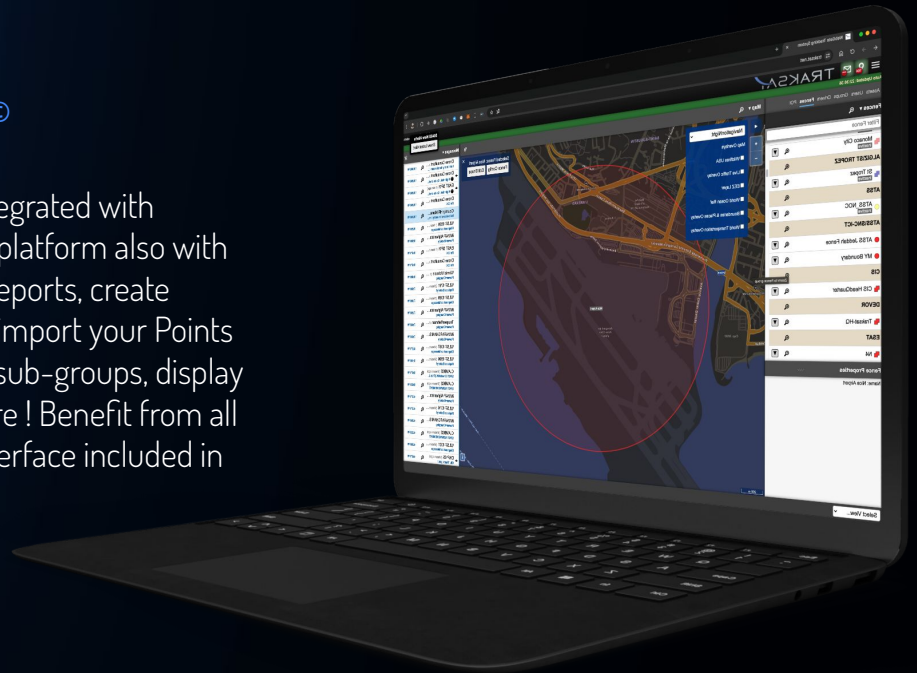

Send very cost-effective predefined or exchange free-text messages from the device itself or from the Traklink app or the Garmin Messenger app paired in bluetooth. Receive on demand some basic or premium weather reports and interconnect with other devices around.

Interactive SOS

Reclaim control of your emergency process: in case of SOS triggered, a high-priority alert will be sent to the platform and can be relayed immediately through email, SMS or even generate a voice call to predefined numbers. Operators can handle and resolve alerts online.

Monitor all your Garmin InReach® Devices on Traksat Web Platform

Like thousands of other device types integrated with traksat.net, enjoy the ease of use of our platform also with the Garmin InReach®. Perform history reports, create geofences, add alerts on special events, import your Points Of Interest, manage various groups and sub-groups, display various mapping options, and much more ! Benefit from all the powerful applications of our web interface included in your monthly subscription fee.

Pair your device with our Traklink app and switch seamlessly from cellular to satellite
(You can also use the full potential of the existing Garmin Apps' ecosystem: Garmin Messenger, Garmin Explore, etc...)

The best of both worlds: Garmin InReach® Hardware, with Traksat Software & Support

Traksat Platform provides real-time situational awareness and asset tracking by consolidating position, status, and message information and enabling data communication with two-way capable devices. The ability to visualize the whole picture – knowing where your assets are, and what state they are in – ensures that your personnel can effectively manage your remote operations.

- Multi-device, multi-network
- Multi-channel notifications
- Team hierarchy management
- Real time tracking & location
- Two way chat with individuals and teams
- Custom SOS notification & routing
- Encrypted messaging
- Tools for visualization & analytics
- Third-party integrations
